INSTALLATION AND SERVICE MANUAL

ATTENTION: READ THIS MANUAL, RISM MANUAL, FACTORY INSTALLED OPTIONS MANUAL, UNIT SUBMITTAL DATA SHEETS AND ALL LABELS ATTACHED TO THE UNIT CAREFULLY BEFORE ATTEMPTING TO INSTALL, OPERATE OR SERVICE THESE UNITS! CHECK UNIT DATA PLATES FOR TYPE OF GAS AND ELECTRICAL SPECIFICATIONS AND MAKE CERTAIN THAT THESE AGREE WITH THOSE AT THE POINT OF INSTALLATION. RECORD THE UNIT MODEL NUMBER AND SERIAL NO.(S) IN THE SPACE PROVIDED. RETAIN THIS DOCUMENT FOR FUTURE REFERENCE.

Model No.

Serial No. _

FOR YOUR SAFETY

The use or storage of gasoline or other flammable vapors or liquids in open containers in the vicinity of this appliance is hazardous.

FOR YOUR SAFETY

If you smell gas:

- 1. Don't touch electrical switches.
- 2. Extinguish any open flames.
 - 3. Immediately call your
 - gas supplier.

AWARNING Improper installation, adjustment, alteration, service or maintenance can cause property damage, injury or death. This appliance must be installed by a licensed contractor or qualified service personnel. Read these installation, operating and maintenance instructions thoroughly before installing or servicing this equipment.

A WARNING Install, operate and maintain unit in accordance with manufacturer's instructions to avoid exposure to fuel substances or substances from incomplete combustion which can cause death or serious illness. The state of California has determined that these substances may cause cancer, birth defects, or other reproductive harm. Install and Service this product to avoid exposure to airborne particles of glasswool fibers and/or ceramic fibers known to the State of California to cause cancer through inhalation.

INSTALLER'S RESPONSIBILITY

Installer Please Note: This equipment has been test fired and inspected. It has been shipped free from defects from our factory. However, during shipment and installation, problems such as loose wires, leaks or loose fasteners may occur. It is the installer's responsibility to inspect and correct any problems that may be found.

CEED us Intertek

J30-05381

RECEIVING INSTRUCTIONS

Inspect shipment immediately when received to determine if any damage has occurred to the unit during shipment. After the unit has been uncrated, check for any visible damage to the unit. If any damage is found, the consignee should sign the bill of lading indicating such damage and immediately file claim for damage with the transportation company. **IMPORTANT:** Look in direction of unit air flow to determine whether unit is right hand or left hand accessible.

260 NORTH ELM ST., WESTFIELD, MA 01085 TEL: (413) 564-5540 FAX: (413) 562-5311 www.mestek.com

Unless otherwise specified, the following conversions may be used for calculating SI unit measurements: 1 foot = 0.305 m 1 inch water column =0.249 kPa1 inch = 25.4 mm 1000 Btu per hour = 0.293 kW1 psig = 6.894 kPa 1000 Btu/Cu. Ft. = 37.5 MJ/m^3 1 pound = 0.435 kg liter/second = CFM x 0.472 1 gallon = 3.785 L meter/second = FPM \div 196.8 1 cubic foot = 0.028 m^3 The following terms are used throughout this manual to bring attention to the presence of potential hazards or to important information concerning the product:

A DANGER Indicates an imminently hazardous situation which, if not avoided, will result in death, serious injury or substantial property damage.

▲ **WARNING** Indicates an imminently hazardous situation which, if not avoided, could result in death, serious injury or substantial property damage.

A CAUTION Indicates an imminently hazardous situation which, if not avoided, may result in minor injury or property damage.

NOTICE: Used to notify of special instructions on installation, operation or maintenance which are important to equipment but not related to personal injury hazards.

I. RECEIVING INSTRUCTIONS

Inspect shipment immediately when received to determine if any damage has occurred to the crate during shipment.

After the unit has been uncrated, check for any visible damage to the unit. Check motor position and turn blower wheel to determine if damage has occurred to these critical parts.

If any damage is found, the cosignee should sign the bill of lading indicating such damage and immediately file claim for damage with transportation company.

PRE-INSTALLATION INSTRUCTIONS

When the unit is received and uncrated, check the external data plate and all labels on the unit for type of gas, electrical, and operational specifications to confirm that these agree with those at point of installation. If the unit is equipped with an Outdoor Duct Furnace, also check the data plate and all labels located inside each furnace.

Every rooftop unit will include an informational packet which will include the following: The blower manual, outdoor duct furnace and evaporative cooler/cooling coil manuals (if applicable to the unit order), wiring diagram(s), factory installed-service convenience options manual (if applicable to unit order) and special controls/data sheets.

NOTICE: It is the owner's responsibility to provide any scaffolding or other apparatus required to perform emergency service or annual/periodic maintenance to this equipment.

II. GENERAL SAFETY REQUIREMENTS

▲ **WARNING** Open all disconnect switches before installing the unit. Failure to do so may result in personal injury or death from electrical shock.

A WARNING Failure to comply with the general requirements may result in extensive property damage, severe personal injury or death.

A WARNING This product must be installed by a licensed plumber or gas fitter when installed within the Commonwealth of Massachusetts.

AWARNING Do not alter the duct furnace in any way or damage to the unit, severe personal injury or death will occur.

A WARNING Never service any component without first disconnecting all electrical and gas supplies to the unit or severe personal injury or death may occur.

A CAUTION Insure that all power sources conform to the unit requirements or damage to the unit may result.

For all units that are equipped with gas fired outdoor duct furnaces (certified by ETL) installation must be made in accordance with local codes, or in the absence of local codes, with the latest edition of ANSI Standard Z223.1 (N.F.P.A. No. 54) National Fuel Gas Code. All of the ANSI and NFPA Standards referred to in these installation instructions are those that were applicable at the time the design was certified. The ANSI Standards are available from the American National Standards Institute, Inc., 11 West 42nd Street, New York, NY, 10036 or www.ansi.org. The NFPA Standards are available from the National Fire Protection Association, Batterymarch Park, Quincy, MA 02269.

If installed in Canada, the installation must conform with local building codes, or in the absence of local building codes, with CSA B149.1 "Installation Codes for Natural Gas Burning Appliances and Equipment" or CSA B149.2 "Installation Codes for Propane Gas Burning Appliances and Equipment". These outdoor duct furnaces have been designed for and certified to comply with CSA 2.8.

These units have been designed **certified for outdoor use only,** and may be located on the roof of the building or at any convenient location external to the building to be heated. Make certain that the power sources conform to the requirements of the heater.

Follow installation instructions CAREFULLY to avoid creating unsafe conditions. All wiring should be done and checked by a qualified electrician, using copper wire only. All gas connections should be made and leak-tested by a suitably qualified individual, per instructions in this manual.

Use only the fuel for which the heater is designed (see nameplate). Using LP gas in a heater that requires natural gas, or vice versa, will create the risk of gas leaks, carbon monoxide poisoning and explosion.

▲ WARNING Do not attempt to convert the heater for use with a fuel other than the one intended. Such conversion is dangerous, as it could create unsafe conditions that result in death, serious injury or substantial property damage.

Make certain that power source conforms to electrical requirements of heater. Disconnect power before installing or servicing heater. If power disconnect is out of sight, lock it in open position and tag it to prevent unexpected application of power. Failure to do so could result in fatal electric shock.

AWARNING Do not depend upon a thermostat or other switch as the sole means of disconnecting power when installing or servicing heater. Always disconnect power at main circuit breaker as described above. Failure to do so could result in fatal electric shock.

Special attention must be given to any grounding information pertaining to this heater. To prevent the risk of electrocution the heater must be securely and adequately grounded. This should be accomplished by connecting a grounded conductor from the service panel to the conduit box of the heater. To ensure proper ground, the grounding means must be tested by qualified field technician.

Do not insert fingers or foreign objects into the heater or its air moving device. Do not block or tamper with the heater in any manner while in operation or just after it has been turned off, as some parts may be hot enough to cause injury.

This heater is intended for general heating applications ONLY. It must NOT be used in potentially dangerous locations such as flammable explosive, chemical-laden or wet atmospheres.

In cases in which property damage may result from malfunction of the heater, a backup system or a temperature sensitive alarm should be used. The venting is an integral part of the unit and **must not be altered in the field**. The Natural Vented units are equipped with a ventcap which is designed for natural draft venting. Air for combustion enters the base of the vent cap through a protective grill and products of combustion are discharged at the upper section of the vent cap. This vent cap is shipped in a separate carton and should be installed per the Venting section of the Outdoor Rooftop Gas-Fired Duct Furnace Installation and Service Manual. The Power Vented unit has a induced draft venting system. The combustion air inlet and products of combustion discharge grills are located in the upper section of the Duct Furnace side access panel.

A pilot burner plate is provided in the Duct Furnace for access to the pilot burner and ignition system without removing the burner drawer. Clearance between the external unit and any obstruction must be sufficient for proper servicing of pull out burner drawer. See Figure 2 & 3 for this clearance.

These units are certified for operation on either natural or propane gases. If a unit is to be installed at an altitude exceeding 2000 feet (610 m) above sea level, derate the unit input of each duct furnace by 4% for each 1000 feet (305 m) above sea level. Special main burner gas orifices are required for installations above 2000 feet (610 m).

In Canada, if unit is to be installed at altitudes of 2000 feet (610 m) to 4500 feet (1372 m), each duct furnace must have the main burners re-orificed to give 90% of the normal altitude input rating.

If the unit was ordered from the factory for high altitude operation, confirm input rating. See Gas Input Adjustment.

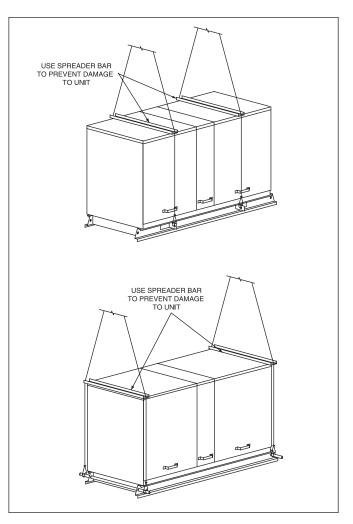

RIGGING

Rig unit using either belt or cable slings. Use spreader bars to protect the top of the unit when it is lifted. See Figure 1.

On units with a total length of less than 104 inch (2642 mm), excluding evaporative cooler, two holes are provided in the base rail on each side of the unit. Slide pipes beneath the unit through these holes and attach rigging to pipes for lifting the unit.

On units with a total length of a 104 inch (2642 mm) or greater, excluding evaporative cooler, lifting lugs attached to the base rail are provided. Attach rigging to lugs for lifting the unit. For distance between lifting lugs and total unit lengths, refer to original Submittal Sheets supplied specified for the unit. Also see Center of Gravity and Weights Sections in this manual.

Figure 1

COMBUSTION AIR CONSIDERATIONS

The presence of chlorine vapors or other corrosive vapors in the combustion air supply for gas-fired heating equipment presents a potential corrosive hazard. Chlorine will, when exposed to flame, precipitate from the compound (usually freon or degreaser vapors) and go into solution with any condensation that is present in the heat exchanger or associated parts. The result is hydrochloric acid which will readily attack all metals, including 300 grade stainless steel. Care should be taken to separate these vapors from the combustion process. This may be done by wise location of the unit with regard to exhausters or prevailing wind direction.

LOCATION

Before placing rooftop unit in its permanent location, make certain that the roof is capable of carrying the additional load of this equipment. Check the unit weight given at the end of this manual.

Refer to Figure 2 & 3 for required clearances to combustible material.

AWARNING Do not place unit in a location where service personnel can not safely service this equipment (i.e. roof edge, skylights, etc.) or personal injury could result.

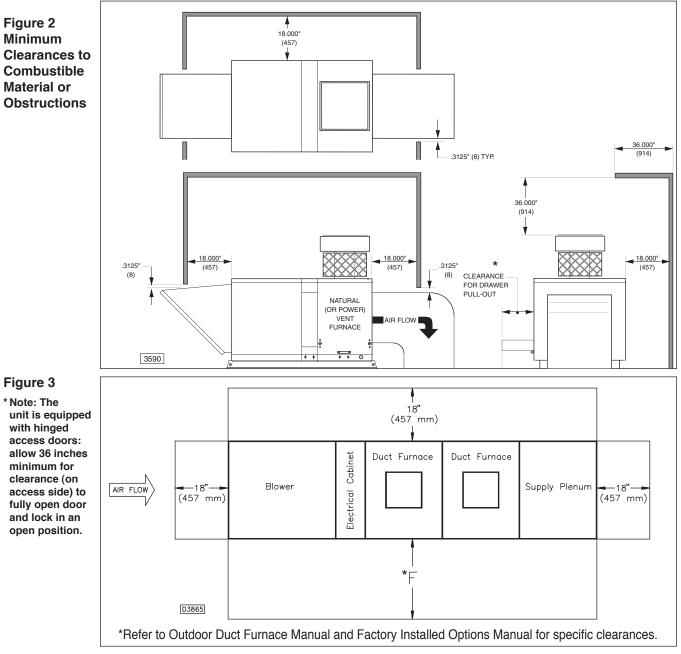

NOTICE: If your unit is equipped with (N2) through the base utilities and/or (N3) service convenience package - refer to Submittal GAN2, review in entirety before mounting the unit.

MOUNTING/LOCATIONS

These units are suitable for installation on combustible flooring.

Single, double and triple duct furnace only models have base rails which can be mounted either on solid planking or steel channels. All other units installed on field furnished supports must use the recommended method shown in Mounting on Field Furnished Supports or equivalent.

Roof curb kits for rooftop units are shipped unassembled. Included with the roof curb kit are insulated or uninsulated curb rails, bolts and screws needed for assembly, sealant, a roll of self-adhering rubber gasketing, and installation instructions. Roof insulation, cant stripping, flashing, roof felts, caulking, and nails must be furnished by the installer. See separate roof curb specifications. See Figures 5, 6, 7 & 8 for roof curb information.

5

III. INSTALLATION

A WARNING Open all disconnect switches and secure in that position before installing unit. Failure to do so may result in personal injury or death from electrical shock.

Installation must conform with local building codes or in the absence of local codes with the latest edition of the National Fuel Gas Code ANSI Z223.1 (N.F.P.A. No. 54) National Fuel Gas Code.

A heat loss study and a complete layout of the system should be made first.

When locating the unit in its permanent location, make certain that the roof is capable of carrying the additional load of the equipment. **Check the unit net weights section of this manual.**

Make certain that clearances are provided for service, minimum clearance to combustible material and to venting cap. See Figure 2 for this information.

Ducts connected to units which do not have either a blower section or a supply plenum must have a removable access panel in the duct, which is connected to a duct furnace. The duct openings shall be accessible when the unit is installed in service and shall be of such size that smoke or reflected light may be observed inside the casing to indicate the presence of leaks in the heating element. The covers for the panels shall be attached in such manner as to prevent leaks. Ducts exposed to the outdoors must be insulated and sealed to prevent water from entering either the unit or building through the duct.

If a single, double or triple duct furnace only unit is connected to a return air duct or any other inlet air restriction, the appliance shall be installed on the positive pressure side of the air circulating blower.

A CAUTION Remove wooden shipping support from beneath blower housing of Blower Section to prevent possible unit damage or improper unit operation (if applicable).

ACCESS PANEL REMOVAL

The air handler section(s) of this unit are equipped with hinged access doors. The hinged doors include dual, quick opening tool-less latches and full perimeter gasketing to assure a water resistant seal. Door stops are included to guard against closure while open.

Other sections are equipped with access panels that are held in place with two "grip" latches. To remove these access panels: use a slotted head screw driver to turn the latch screwhead counterclockwise. Using the handle provided, push the panel upwards. Pull the bottom of the panel out and lower the panel to disengage it from the top lip. To replace access door panels: guide the panel door upwards on the tracks, and push up into the top lip, swing and lower the panel in place until it engages with the bottom panel. Turn the screwhead on each latch clockwise. The screw must turn freely one quarter turn before resistance is felt in order for the lock to engage. If latch does not hold, turn screw counter-clockwise several turns and repeat the above procedure.

INSTALLATION CLEARANCES

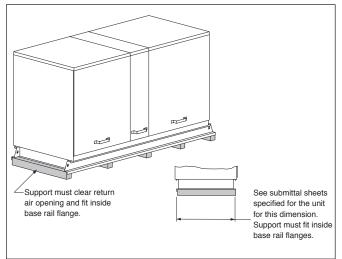

Minimum clearances to combustible material are shown on the unit data plate. It is important that clearances be maintained for servicing the unit (refer to Submittal Insert for service clearances), and that minimum clearances are provided from the unit (including vent cap, if Natural Vent model) to combustible material. Clearances around the outside air hood (if unit is so equipped) must be unobstructed. See Figure 2.

MOUNTING ON FIELD FURNISHED SUPPORTS

Single, double, triple duct furnace only models have base rails which are suitable for mounting either directly on solid planking or steel channels. Never install the unit on a soft roof where the rails could sink, reducing clearance between the bottom panel and the roof, or cause damage to the roofing surface.

All other models must use the following method or an equivalent when unit supports are field furnished: Each section of the Rooftop unit must be supported, which includes supports located at both ends. If the unit consists of a High CFM Blower section, a DX Coil, a Duct Furnace and a Supply Plenum, five supports are required. See Figure 4.

MOUNTING ON ROOF CURB

Assemble and install roof curb per Roof Curb Installation Instructions. See Figures 5, 6, 7 & 8 for roof opening sizes, distance between openings and unit relationship to roof curb.

Figure 5 - Roof Curb Kits Dimensional Data

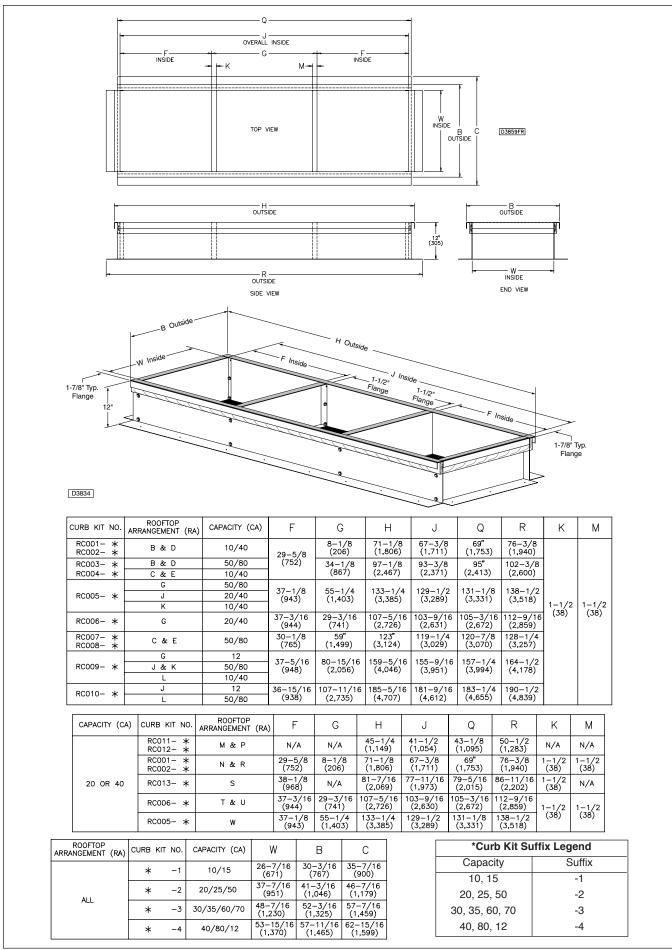

Figure 6

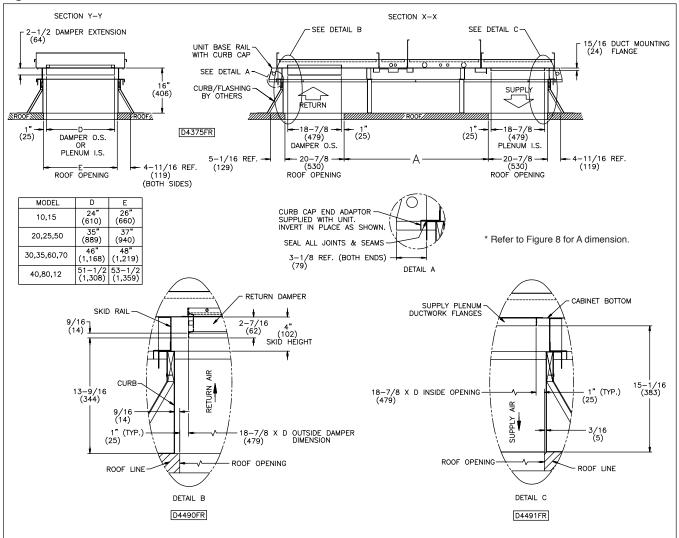

Figure 7 - Unit/Curb End Rail Assembly

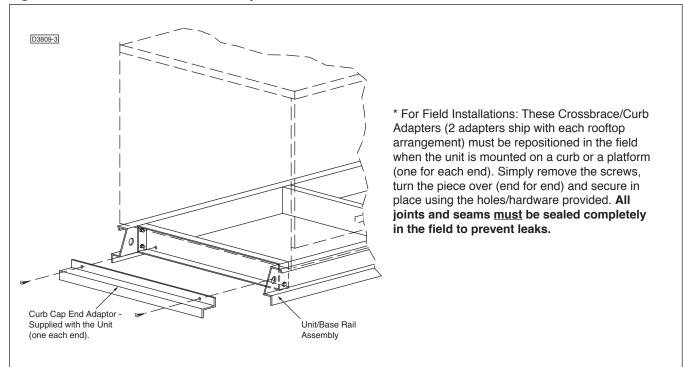

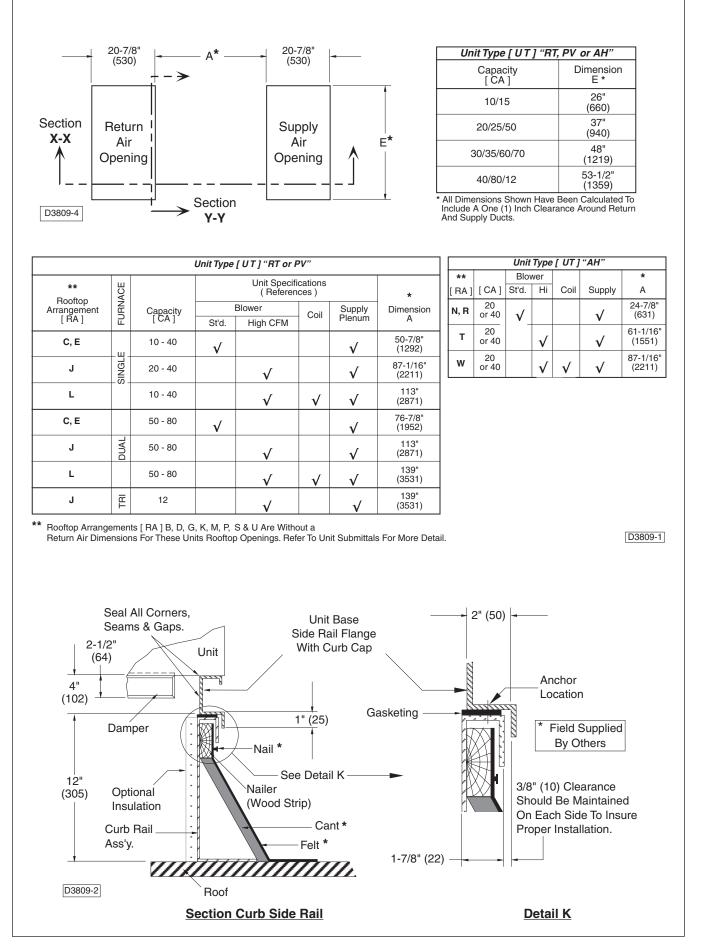

Figure 8 - Roof Curb Specifications

VENTING†

All venting installations shall be in accordance with the latest edition of Part 7, "Venting of Equipment", of the National Fuel Gas Code, ANSI Z223.1 or applicable provisions of local building codes.

AWARNING The venting is an integral part of the unit and must not be altered in the field.

The Natural Vented units are equipped with a vent cap which is designed for natural draft venting. Air for combustion enters the base of the vent cap through a protective grill and products of combustion are discharged at the upper section of the vent cap. **† This vent cap is shipped in a separate carton and should be installed per the Venting section of the Outdoor Rooftop Gas-Fired Duct Furnace Installation and Service Manual.**

The Power Vented unit has a induced draft venting system. The combustion air inlet and products of combustion discharge louvers are located in the upper section of the Duct Furnace side access panel. Never locate these units in an area where the flue products discharge outlet may be directed at any fresh air vents. See the Outdoor Rooftop Gas-Fired Duct Furnace Installation and Service Manual for installation and servicing requirements.

DUCT CONNECTIONS

All ductwork must be properly supported so that no strain is put on the unit. Do not alter or bend the discharge duct flanges supplied on your furnace/air handler.

Ducts connected to units which do not have either a blower section or a supply plenum must have a removable access panel in the duct which is connected to a duct furnace. The duct openings shall be accessible when the unit is installed in service, and shall be of such size that smoke or reflected light may be observed inside the casing to indicate the presence of leaks in the heating element. The covers for the panels shall be attached in such a manner as to prevent leaks. Ducts exposed to the outdoors must be insulated and sealed to prevent water from entering either the unit or building through the duct.

If a single, double or triple duct furnace only unit is connected to a return air duct, or any other inlet air restriction, the appliance shall be installed on the positive pressure side of the air circulating blower.

When connecting return air duct to Standard or High CFM cabinets, attach duct to return air opening flange when no dampers are used. Otherwise, if dampers are used, attach return air duct around collar at bottom of damper assembly. Also refer to the Submittal Data Sheets specified for your unit.

When connecting supply air duct to Supply Plenum, attach duct to supply air opening flange when no dampers are used. Otherwise, if dampers are used, attach supply air duct around collar at bottom of damper assembly.

GAS PIPING^{††}

All gas piping must be installed in accordance with local codes. It is required that a ground union be installed adjacent to the gas valve of each duct furnace, and a ground union be installed just external of each duct furnace for unit servicing. On vertical runs, a drip leg should be provided upstream of any control manifold. A gas shutoff valve should be, or may be required by local codes, installed upstream of the external ground union for each duct furnace. A 1/8 inch N.P.T. plugged tapping, accessible for test gauge connection, must be installed immediately upstream of the unit gas supply connection.

†† For complete Gas Piping installation, see Outdoor Rooftop Gas-Fired Duct Furnace Installation and Service Manual, and if applicable the Factory Installed Options Manual.

It is recommended that the gas piping not be installed through the bottom of the duct furnace bottom panel. If piping must penetrate the duct furnace bottom panel, it must be sealed to prevent water leakage.

Gas piping must be installed to allow for removal of burner drawer for unit maintenance.

AWARNING To avoid equipment damage or possible personal injury, do not connect gas piping to this unit until a supply line pressure/ leak test has been completed. Connecting the unit before completing the pressure/leak test may damage the unit gas valve and result in a fire hazard.

A CAUTION Do not rely on a gas shutoff valve to isolate the unit while conducting gas pressure/leak tests. These valves may not be completely shutoff, exposing the unit gas valve to excessive pressure, resulting in damage.

A CAUTION Do not over-tighten the inlet gas piping at unit gas valve or stresses that could crack the valve may result.

A WARNING Never use an open flame to detect gas leaks. Explosive conditions may exist which would result in personal injury or death.

The gas line should be supported so that no strain is placed on the unit. Pipe compounds which are not soluble to liquid petroleum gases must be used on threaded joints.

The appliance and its individual shutoff valve must be disconnected from the gas supply piping system during any pressure testing of that system at test pressures in excess of 1/2 psi (3.5 kPa).

The appliance must be isolated from the gas supply piping system by closing the individual manual shutoff valve during any pressure testing of the gas supply piping system at test pressures equal to or less than 1/2 psi (3.5 kPa).

For additional gas piping information, including pipe sizing and drip leg installation, refer to Outdoor Rooftop Gas-Fired Duct Furnace Installation and Service Manual.

For additional piping information, refer to the National Fuel Gas Code Z233.1 (latest edition).

NOTICE: If the gas duct furnace is to be fired with LP gas, consult local LP gas dealer for piping size information.

NOTICE: UNIT INSTALLATION FOR USE WITH PROPANE (BOTTLED) GAS MUST BE MADE BY A QUALIFIED LP GAS DEALER OR INSTALLER. HE WILL INSURE PROPER JOINT COMPOUNDS ARE USED FOR MAKING PIPE CONNECTIONS; THAT AIR IS PURGED FROM LINES; THAT A THOROUGH TEST IS MADE FOR LEAKS BEFORE OPERATING THE UNIT; AND THAT IT IS PROPERLY CONNECTED TO PROPANE GAS SUPPLY SYSTEM.

Before any connection is made to an existing line supplying other gas appliances, contact the local gas company to make certain that the existing line is of adequate size to handle the combined load.

Check all connections for leaks with soap solution.

A WARNING Never use an open flame to detect gas leaks. Explosive conditions may exist which would result in personal injury or death.

MODULATING GAS CONTROL (OPTIONAL)*

*Also refer to Outdoor Duct Furnace Installation Manual supplied with your unit.

Electronic: On units equipped with electronic modulating control, follow control manufacturer's installation instructions for sensing of outlet air temperature.

ELECTRICAL CONNECTIONS

A WARNING

HAZARDOUS VOLTAGE! DISCONNECT ALL ELECTRIC POWER INCLUDING REMOTE DISCONNECTS BEFORE SERVICING. Failure to disconnect power before servicing can cause severe personal injury or death.

All electrical connections must conform to the latest edition of ANSI/NFPA No. 70 National Electrical Code and applicable local codes. In Canada, to the Canadian Electrical Code, Part I CSA Standard C22.1.

The rooftop packaged unit is wired at the factory and ready to be connected. Actual unit wiring will differ according to the options chosen. Each unit is shipped with its own wiring diagram; refer to this wiring diagram for all electrical connections to the unit.

All electrical connections, line voltage and thermostat, are made in the Electrical Cabinet (See Figure 9). Line voltage connections are made at the High Voltage Terminal Block. Thermostat connections are made at the Main Connection Board (See Figure 10).

A CAUTION Do not use any tools (i.e. screwdriver, pliers, etc.) across terminals to check for power. Use of a voltmeter is recommended.

Outdoor line voltage conduits leading into the unit should be installed to prevent rain from wetting any high voltage wire. Locate the thermostat in accordance with the instructions supplied with the thermostat. All field wiring must have a minimum temperature rating of 185°F (85°C). Control wiring must be a minimum of 18 gauge wire size. Control wiring must be sized for the length of run.

Locate line voltage disconnect box per local codes. If mounting the disconnect box to the unit, never mount it to an unit access panel. Possible locations include the front of the blower or filter section, the outdoor air hood or the rear of the supply plenum (See Figure 11). Electrical conduit must be routed so as not to interfere with removal of any access panel.

NOTICE: Should any original wire supplied with the unit have to be replaced, it must be replaced with wiring having a temperature rating of at least 221°F (105°C).

Figure 11 - Disconnect Box Locations

DX COIL EQUIPPED UNITS (OPTIONAL)

See Coil Installation/Maintenance Manual for Refrigerant Piping, Liquid and Suction Line Components, Refrigerant Charging and Thermal Expansion Valve Adjustment. Remove coil cabinet access door located next to blower section. Cut holes in fixed door to allow suction and liquid line passage. Provide weatherproof seal around suction and liquid lines at piping plate when installed.

The DX Coil has a 300 ft/min. (1.524 m/s) minimum and a 600 ft/min. (3.048 m/s) maximum velocity through the coil requirement. This is due to prevention of coil icing or condensate blow-off. To calculate the velocity through the coil, apply the following formula:

Velocity	=	Cooling Air Flow in CFM (m ³ /s)
through the coil		Coil Surface Area in ft ² (m ²)

Condensate Drain piping must have a P-trap in line immediately downstream of drain pan connection, external to the unit, to prevent possible outside air leakage into unit. The P-trap shall be of sufficient differential to overcome negative pressure of the indoor air blower. A minimum height difference of 2 inch is required (See Figure 12). Before unit operation begins, the P-trap must be primed with either water (summer) or glycol (winter).

CHILLED WATER COIL EQUIPPED UNITS (OPTIONAL)

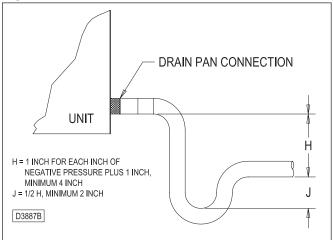

See Coil Installation/Maintenance Manual for General Coil Piping Recommendations. Remove the coil cabinet door and cut holes in door to allow chilled water piping passage. Provide weatherproof seal around chilled water pipes at piping plate when installed.

The Chilled Water Coil has a 600 ft/min (3.048 m/s) maximum velocity through the coil requirement. This is due to prevention of condensate blow-off. To calculate the velocity through the coil apply the following formula:

Velocity	=	Cooling Air Flow in CFM (m ³ /s)
through the coil		Coil Surface Area in ft ² (m ²)

Condensate Drain piping must have a P-trap in line immediately downstream of drain pan connection, external to the unit, to prevent possible outside air leakage into unit. The P-trap shall be of sufficient differential to overcome negative pressure of the indoor air blower. A minimum height difference of 2 inch is required (See Figure 12). Before unit operation begins, prime P-trap with either water (summer) or glycol (winter).

Figure 12 - Drain Pan Connection

EVAPORATIVE COOLER EQUIPPED UNITS (OPTIONAL)

Refer to Evaporative Cooler Installation and Service Manual for water and electrical connections.

IV. OPERATION

GENERAL INFORMATION

Refer to Outdoor Rooftop Gas-Fired Duct Furnace Installation and Service Manual for specific information regarding the heating operation of this unit.

All units are equipped with a intermittent pilot ignition system. The pilot is lit and extinguished each cycle of unit heating operation.

On natural gas units, the ignitor will continue to spark and pilot gas will continue to flow until the pilot flame is proven.

LP (propane) units are equipped with 100% lockout. The lockout function shuts off the main and pilot gas valves if the pilot gas fails to ignite within 90 seconds of the onset of trial for ignition.

The gas control system operates at 24 VAC and is supplied by a stepdown transformer found in the electrical cabinet that will match the unit line voltage specified. See Figure 10 for unit controls location.

Do not use a thermostatic fan control switch when either two-stage firing or modulated gas controls are used.

GAS CONTROL SYSTEM

The standard unit comes equipped for single stage operation. Unit heating operation is accomplished at full input. Each duct furnace is equipped with an individual ignition control system which consists of the following components: ignition control module, gas valve and pilot burner.

The **ignition control module** is the heart of the ignition control system. This control initiates all gas flow, provides means to light the pilot burner, proves and monitors the pilot burner operation.

The **gas valve** consists of two operators which provide gas to the pilot and main burners. Both operators are energized and de-energized by the ignition control module each heating cycle.

The **pilot burner** includes an ignitor and flame sense probe. The ignitor provides the spark, originating at the ignition control module, to light the pilot. The ignition control module proves and monitors the pilot flame through the flame sensing probe. All units follow the same basic sequence of operation and is as follows:

- Thermostat calls for heat.
 Power vented units only: Draftor relay energizes draftor with call for heat.
- 2. Ignition control module energizes pilot operator of gas valve and initiates spark at ignitor of the pilot burner.
- 3. Pilot burner ignition is proven to the ignition control by the flame sense probe and sparking of the ignitor is discontinued.
- 4. Once pilot burner operation is proven, the ignition control module energizes the main burner operator of the gas valve, allowing gas flow to the main burners. Power vented units only: In addition, draftor operation must be proven by draftor end switch before ignition control module energizes main burner operator of gas valve.
- 5. Approximately 60 seconds after the main burners light the fan time delay initiates fan operation.
- 6. Thermostat is satisfied and call for heat is removed. **Power vented units only:** Draftor relay de-energizes draftor with removal of call for heat.
- 7. Ignition control module de-energizes pilot and main burner operators of the gas valve, ceasing all gas flow.
- 8. Approximately two minutes after satisfying the thermostat, fan operation ceases.

OPTIONAL GAS CONTROLS

These units are available with optional gas controls which will give either multi-stage or modulating operation. The sequence of operation of those units equipped with these optional gas controls differs only at what rate each duct furnace's main burners ignite and operate at or the order of duct furnace firing for those units equipped with two or three duct furnaces.

Two Stage Units: Two stages of heating; first stage is 40% of full rate, second stage is 100% of full rate. Main burner ignition is at first stage only.

Three Stage Units: *Dual duct furnace models:* First furnace is equipped with two stage heating; second furnace is equipped with a single stage heating but fired independently giving three stages of heating.

Triple duct furnace models: Each duct furnace is equipped with single stage heating but fired independently, giving three stages. Each stage is 33% of the unit's full input rate. Duct furnace one will always light first and disengage last.

Four Stage Units: Dual duct furnace models only. Each duct furnace is equipped with two stage heating but fired independently, giving four stages. Each stage is 25% of the units full input rate. Duct furnace one will always light first and disengage last.

Six Stage Units: Triple duct furnace models only. Each duct furnace is equipped with two stage heating but fired independently giving six stages. Each stage is 16.5% of the units full input rate. Duct furnace one will always light first and disengage last.

Electronic Modulation Units: These units are equipped with a electronic modulating control which provides unit firing capabilities of 40 to 100% of the units full input rate. This control is found in the gas train downstream of the gas valve and allows main burner ignition only at the maximum rate. A thermostat with remote setpoint adjustment modulates the gas input.

Multi-Stage w/ Electronic Modulation Units: These dual and triple duct furnace models are equipped with an electronic modulating control on duct furnace one and single or two stage heating on each successive duct furnace. Furnace one (modulated) will fire first and disengage last. Additional stages of heat will engage after furnace one has fired at maximum modulation capability for the duration of the delay setting. The amount of modulation and each stage size depends upon unit size and the number of stages. See following chart.

Number of Stages	Modulation Capabilities (% of full input)	Stage Size (% of full input)
2	25 - 50	50
3	16.5 - 33	33
4	25 -50	25
6	16.5 - 33	16.5

AIR HANDLING REQUIREMENTS AND ADJUSTMENTS

A CAUTION Remove wooden shipping support from beneath blower housing of Blower Section to prevent possible unit damage or improper unit operation (if applicable).

Static Pressure through the unit should never exceed 2.0 inch W.C. (0.50 kPa). The standard unit is operated at a temperature rise range of 20 to 60° F (11 to 33° C). The high temperature rise model is operated at a temperature rise range of 60 to 90° F (33 to 50° C).

NOTICE: It is important that the final temperature leaving the unit does not exceed 160°F (71°C). When final air throughput adjustments are being made, a check of the discharge air temperature should be made after unit has operated for 15 to 20 minutes.

A CAUTION A unit should never be allowed to cycle on the primary limit for a prolonged period of time. It is a safety control to prevent a fire. If cycling on the primary limit is noted, corrective measures should be taken immediately. Failure to do so could result in unit damage or a fire.

NOTICE: At initial unit installation, unit should be started momentarily to confirm proper blower wheel rotation as the unit will deliver some air with the blower wheel running backwards.

Two basic air control systems can be used to deliver conditioned air to the occupied space: intermittent or constant fan operation.

Intermittent Fan Operation: The unit employs an air control system which utilizes a fan time delay relay to operate the fan while heating and the thermostat while cooling. Refer to unit wiring diagram.

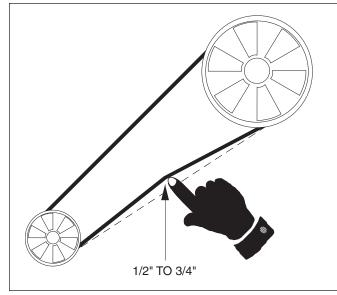

Constant Fan Operation: The unit can be wired to give an air control system which constantly circulates air through the unit and occupied space with constant fan operation. Refer to unit wiring diagram.

NOTICE: Check blower belt tension. Proper belt tension is important to the long life of the belt and motor. Proper belt tension will allow the belt to be depressed 1/2 inch to 3/4 inch.

It is important that the blower motor and the blower wheel pulleys be in good alignment, with the motor and blower shafts parallel.

Belt tension must be adjusted to give approximately 3/4 inch deflection of the belt when finger pressure is applied to the middle of the belt (See Figure 13). Small changes in this tension may be necessary for optimum operation. Belts will stretch over a period of time, requiring an adjustment to this tension. See MAINTENANCE section for belt and pulley adjustments.

Figure 13 - Belt Tension Guide

These units are set at the factory for the RPM required to meet the air volume (CFM) and external static pressure ordered. If the estimated external static is incorrect, or changes were made to the duct system, the blower RPM may need to be changed.

Both the Standard and High CFM Blowers use motors which are equipped with adjustable pitch pulleys. After removing belt(s), loosen the pulley set screw and remove the key, turn adjustable half of a pulley clockwise to increase RPM, or counter-clockwise to decrease RPM. Insert key, tighten set screw and replace belt(s). Adjust belt tension to give 1/2 inch to 3/4 inch belt play when depressed.

A CAUTION Blower motor full load amps should never be exceeded. Improper unit operation or motor failure could result.

After changing blower RPM, confirm blower motor full load amps have not been exceeded. See motor data plate for maximum full load amps.

LIGHTING

(Refer to Outdoor Duct Furnace Manual for all heating functions - general comments are as follows.) Purge the gas line to the unit of air before attempting to light the pilot. Check for gas leaks.

A WARNING Never use an open flame to detect gas leaks. Explosive conditions may exist which could result in personal injury or death.

This unit is equipped with an intermittent ignition system. A lighting instruction is attached to the unit. To set the intermittent ignition system into operation proceed as follows:

- 1. Turn on the gas valve(s) main manual valve.
- 2. Turn on electrical power. The unit is now under thermostat control.

- 3. Set thermostat to highest level. This will initiate the sequence of operation detailed in the Gas Control System section. Check main burners for operation.
- 4. Set thermostat to lowest level. This will interrupt power to the ignition control and shut off gas. Confirm pilot and main burners have been extinguished.
- 5. Set the thermostat to the desired setting.

For complete unit shutdown, proceed as follows:

- 1. Turn off the gas valve(s) main manual valve.
- 2. Set thermostat to lowest setting.
- 3. Shut off all electric power.

GAS INPUT ADJUSTMENT

When shipped from the factory, all units are equipped for the average heat content of the gas which is stamped on the unit rating plate.

A CAUTION Since the heat content of gas varies by locality, the input must be checked after installation of the unit. If the unit is overfired it will shorten the life of the heat exchanger. Never exceed the input on the rating plate.

For an accurate input rate measurement the following meter method should be used to determine unit input rate. If the meter method is not possible, a manifold pressure check should be made.

Meter Method of Checking Input Rate

- Obtain the heating value of the gas from the local utility or gas dealer. This should be in units of Btu/ft³ (MJ/m³).
- 2. Determine the gas flow rate as shown in the following example. EXAMPLE: Assume this unit has a input rate of 250,000 Btu/hr (73.2 kW) and the heating value of the gas is 1000 Btu/ft³ (37.3 MJ/m³).

	250,000 Btu/hr (73.2 kW)	
Flow Rate	=	1000 Btu/ft ³ (37.3 MJ/m ³) x 60 min/hr
	=	4.17 ft³/min (1.974 L/s)

- 3. Before determining the gas flow rate to the unit, all other gas appliances connected to the same meter must be turned off.
- 4. Fire unit according to instructions.
- 5. After approximately 15 minutes of unit operation, determine volume of gas used in five minutes of unit operation. For the Example above the unit should use 4.17 ft³/min x 5 min or 20.8 ft³ (1.97 L/s x 5 min x 60 s/min = 591L) of gas. Minor input adjustments can be made by removing pressure regulator cap and turning regulator clockwise to increase input or counter clockwise to decrease input. Any appreciable adjustment in input rate should be made by reorificing.

Method to Check Manifold Pressure

- 1. Close the manual valve of unit gas valve.
- 2. Install a 1/8 inch pipe connection in the tapped hole provided in the gas valve body near outlet of the valve.
- 3. Attach manometer to 1/8 inch pipe connection by means of a rubber hose.
- 4. Fire unit according to instructions and observe the pressure and confirm it matches the unit manifold pressure from the unit rating plate.
- Small variations in the manifold pressure can be made by means of the gas valve pressure regulator. Remove pressure regulator cap and turn regulator clockwise to increase pressure or counter-clockwise to decrease pressure.

PILOT ADJUSTMENT

- 1. Disconnect wire from terminal marked MV at gas valve.
- 2. Provide call for heat.
- 3. Pilot adjustment is found on the gas valve. Remove pilot adjustment cap.
- 4. Adjust the pilot screw to provide properly sized flame.
- 5. A proper pilot burner flame is a soft steady flame that envelopes 3/8 to 1/2 inch (9.5 to 12.7mm) of the flame sense probe tip.
- 6. Replace the pilot adjustment cap.
- 7. Reconnect wire to terminal MV.

PRIMARY AIR SHUTTER ADJUSTMENT

After the unit has been in operation for at least 15 minutes, adjust the primary air flow to the burners. Turn the friction-locked manually rotated air shutters clockwise to close, counter clockwise to open. For correct air adjustment, close the air shutter until yellow tips in the flame appear. Then open the air shutter to the point just beyond the position where yellow tipping disappears.

CONTROLS

Primary Limit Control: The primary limit control is a factory installed component surface mounted in the inlet airstream at the end of the heat exchanger. When the temperature reaches the limit setpoint, normally caused by insufficient air throughput, all gas is shutoff. The limit control has an automatic reset and once the unit has cooled, it will reset itself. This is a safety control and if cycling on the primary limit is noted, corrective action must be taken. See unit wiring diagram for electrical location. This control must never be bypassed. Upon completion of unit installation, the primary limit must be checked for proper operation. This can be accomplished by removing power to the indoor air blower and a call for heat.

Draftor End Switch: This switch is located at the end of the draftor motor and is integral to the motor. The switch, which is normally open, will close when draftor motor attains the minimum speed for proper combustion allowing main burner operation. The pilot burner will light without a proven draftor end switch. See unit wiring diagram for electrical location.

Clogged Filter Switch: (Optional) The clogged filter switch monitors the pressure differential across the air filters. If this pressure differential becomes too great, the switch will alert of this condition. At this point the air filters must either be cleaned or replaced. The switch will reset itself.

Firestat: (Optional) Located in either the return airstream, the supply airstream, or both, this control monitors temperatures with setpoints which are field adjustable. If the temperature exceeds the setpoint, the control will cease unit operation. To resume unit operation, a manual reset of this control is required.

Freezestat: (Optional) Located in either the return airstream, the supply airstream, or both, this control monitors temperatures with setpoints which are field adjustable. If the temperature does not exceed the setpoint, the control will cease unit operation.

V. START UP

Before starting the unit, use the "Installation Check Sheet" (located at the end of this manual) and read the Outdoor Duct Furnace Manual entirely in conjunction with the procedures outlined below to ensure that the unit is completely and properly installed and ready for start up.

AWARNING Installer's responsibility! All safety controls must be checked! Check and test the operational functions of all safety devices supplied with this unit. Failure to do so could result in unsafe conditions, and may result in death, serious injury or property damage.

- Inspect all wiring connections; connections should be clean and tight. Trace circuits to insure that actual wiring agrees with the "as wired" diagrams provided with the unit. Information in the wiring diagram title block should match the data appearing on the unit nameplate.
- 2. Lubricate all electrical motors according to the manufacturer's recommendations.
- 3. Verify that the system switch is in the OFF position.
- 4. Check unit supply voltage to ensure that it is within the utilization range.
- 5. Inspect the interior of the unit; remove any debris or tools which may be present.

Starting Unit in Heating Mode

1. Close the unit disconnect switch which provides power to the unit.

AWARNING High voltage is present in some areas of the unit (primarily the main electrical cabinet) with the unit disconnect switch closed. Failure to exercise caution when working in the presence of energized electrical components may result in injury or death from electrical shock.

- 2. Set the thermostat/switching subbase as indicated below:
 - a. position the heating system switch at either HEAT or AUTO;
 - b. set the fan switch to AUTO.
- 3. Place the system switch in the ON position.

With the thermostat calling for heat, unit operation is automatic.

Starting Unit in Cooling Mode

1. Close the unit disconnect switch which provides power to the unit.

AWARNING High voltage is present in some areas of the unit (primarily the main electrical cabinet) with the unit disconnect switch closed. Failure to exercise caution when working in the presence of energized electrical components may result in injury or death from electrical shock.

- 2. Set the thermostat/switching subbase as indicated below:
 - a. position the cooling system switch at either COOL or AUTO;
 - b. set the fan switch to AUTO.
- 3. Place the system switch in the ON position.

With the thermostat calling for cooling, unit operation is automatic.

Final Checkout

Run the unit sequentially through its stages of heating and cooling. Once proper unit operation is verified, perform these final steps:

- 1. Inspect unit for debris and/or misplaced tools and hardware.
- 2. Be sure all gas valves and controls are in the operating position if the unit will be operating immediately.
- 3. Cycle unit on all safety controls to verify proper unit operation.
- 4. Confirm proper operating control (thermostat or ductstat) operation by cycling unit.
- 5. Secure all exterior panels in place.

VI. MAINTENANCE

A WARNING Open all disconnect switches and secure in that position before servicing unit. Failure to do so may result in personal injury or death from electrical shock.

A WARNING Gas tightness of the safety shutoff valves must be checked on at least an annual basis.

To check gas tightness of the safety shut-off valves, turn off the manual valve upstream of the appliance combination control. Remove the 1/8 inch pipe plug on the inlet side of the combination control and connect a manometer to that tapping. Turn the manual valve on to apply pressure to the combination control. Note the pressure reading on the manometer, then turn the valve off. A loss of pressure indicates a leak. If a leak is detected, use a soap solution to check all threaded connections. If no leak is found, combination control is faulty and must be replaced before putting appliance back in service.

These units have been developed for outdoor installation. Maintenance is required and it is suggested that the following unit servicing and inspections be performed routinely. Also read in entirety and refer to the Outdoor Duct Furnace Manual for maintenance requirements.

A WARNING Service technician's responsibility! All safety controls must be checked! Check and test the operational functions of all safety devices supplied with this unit. Failure to do so could result in unsafe conditions, and may result in death, serious injury or property damage.

Inspect area near unit to be sure that there is no combustible material located within the minimum clearance requirements (See Figure 2). Service panels provide easy access to the gas controls (located in duct furnace section), the blower compartment, the electrical cabinet and the supply plenum. To remove the service door from any of these compartments, refer to access panel removal section in beginning of this manual.

The pilot burner can be serviced by removing the pilot plate from the main burner drawer assembly.

To remove the main burner drawer assembly (also refer to Outdoor Rooftop Duct Furnace Installation and Service Manual) for servicing the burners, proceed as follows:

- 1. Shut off the gas supply at the gas shutoff valve and electrical power to the unit.
- 2. Break the union upstream of duct furnace gas valve and loosen the union external to the furnace; swing downward the piping to clear drawer.
- 3. Disconnect duct furnace gas valve wiring taking note of all wire locations. Disconnect ignitor and flame sensing probe wires at ignition control module and any other wires.

- 4. Remove the locking screws holding the burnerdrawer assembly in position.
- 5. Slide the burner drawer out of the duct furnace.
- Removal of burners is accomplished by sliding burner towards manifold, compressing locating spring, until the rear of the burner clears slot in back of burner drawer.
- 7. With burner drawer removed from duct furnace, inspect the inside surfaces of the heat exchanger. Wire brush if necessary.
- 8. Remove any dirt, dust or other foreign matter from the burners using a wire brush and/or compressed air. Insure all parts of the burner are unobstructed. Inspect and clean pilot burner if necessary.
- 9. Reassemble the duct furnace by replacing all parts in order.
- 10. Light unit per the unit lighting instructions.
- 11. Check the burner adjustment. See the "Primary Air Adjustment" section of this manual.
- 12. Check all gas control valves and pipe connections for leaks.

A WARNING Under no circumstance should combustible material be located within the specified clearances. Failure to provide proper clearance could result in personal injury or property damage from fire.

- 13. Check the operation of the duct furnace gas valve by lowering the setting of the thermostat, stopping the operation of the duct furnace. The duct furnace gas valve should close, extinguishing the pilot and main burner flames.
- 14. Inspect and service the blower section of the system.

The unit should be thoroughly checked before the start and at the end of each heating and cooling season.

- 1. Motors and belts should be inspected.
- 2. Tighten belts if loose.
- 3. Check and clean DX or Chilled Water coil twice yearly, if unit is so equipped per manufacturer's service manual. Chilled Water coil must be winterized at beginning of heating season (i.e. drain water from coil per manufacturer's instructions).
- 4. Check air throughput at beginning of heating season to confirm unit operation is within the specified temperature rise range.
- 5. At beginning of heating season clear Condensate Drain Pan and P-trap of water if unit is equipped with DX or Chilled water coil. Clean out drain pan and fill P-trap with a non-toxic glycol solution.
- 6. Evaporative cooler must be cleaned and maintained per manufacturer's instruction frequently during the operating season.
- 7. Inspect Control Dampers during periodic maintenance. Damper pivot points should be cleaned to ensure free damper operation.
- 8. Blower wheels should be checked periodically for dirt build-up on blades. Clean as required.

FILTERS

It is recommended that air filters be changed or cleaned at least four times a year. More frequent attention to filters is required if the air being handled by the unit is unusually dirty. Air flow reduction, caused by the dirty air filters, will increase the discharge air temperature and may cause unit cycling on the primary limit.

Filters (by others) should be serviced regularly and changed or washed when necessary to maintain the required air throughput. In a dusty environment, filters may clog up in less than one month.

High CFM Blower Air Filter Size Requirements

	Number of Filters Required	
Unit Input	16 x 20 (in)	20 x 20 (in)
200 MBtuh (58.6 kW)		8
250 MBtuh (73.2 kW)		8
300 MBtuh (87.9 kW)	8	4
350 MBtuh (102.6 kW)	8	4
400 MBtuh (117.2 kW)		12
500 MBtuh (146.5 kW)		8
600 MBtuh (175.8 kW)	8	4
700 MBtuh (205.1 kW)	8	4
800 MBtuh (234.4 kW)		12
1,200 MBtuh (351.6kW)		12

Standard CFM Blower Air Filter Size Requirements

	Number of Filters Required	
Unit Input	16 x 20 (in)	20 x 20 (in)
100 MBtuh (29.3 kW)	4	
150 MBtuh (44.0 kW)	4	
200 MBtuh (58.6 kW)		4
250 MBtuh (73.2 kW)		4
300 MBtuh (87.9 kW)	4	2
350 MBtuh (102.6 kW)	4	2
400 MBtuh (117.2 kW)		6
500 MBtuh (146.5 kW)		4
600 MBtuh (175.8 kW)	4	2
700 MBtuh (205.1 kW)	4	2
800 MBtuh (234.4 kW)		6

AIR BLOWER

Belt Tension Adjustment Standard CFM Blower belt tension can be adjusted by loosening motor mounting bolts marked A (See Figure 14). To tighten belt, slide motor down motor mounting bracket and re-fasten motor to mounting bracket.

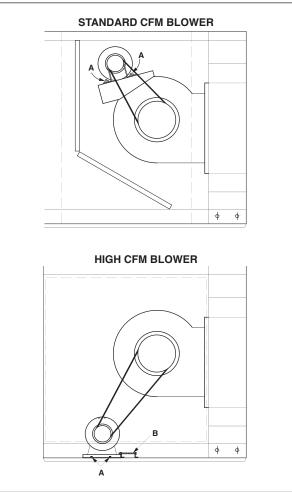

High CFM Blower belt(s) tension can be adjusted by first loosening motor mounting plate bolts marked A (See Figure 14). To tighten belt tension, turn belt tension adjustment screws marked B (See Figure 14) counterclockwise. To loosen belt tension, turn clockwise. Once belt tension has been adjusted, re-fasten motor mounting plate bolts.

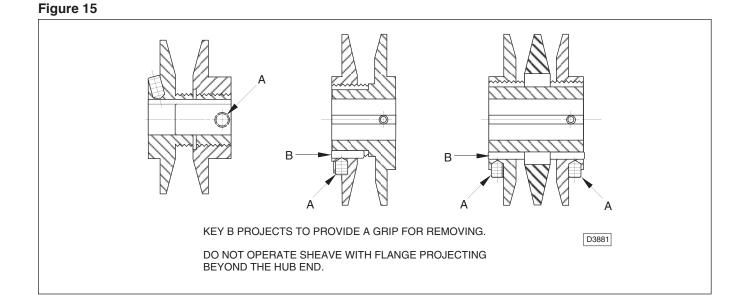

Blower RPM Adjustment

To adjust blower RPM:

- 1. Loosen and remove belt(s).
- 2. Match driver pulley to one found in Figure 15.
- 3. Loosen setscrew(s) marked A.
- 4. If driver pulley is equipped with external key, marked B, remove.
- 5. Adjust driver pulley pitch diameter for desired speed by opening (slower) or closing (faster) moving parts by half or full turns. Do not open sheave past point where flange projects past the hub end.
- 6. If driver pulley is equipped with external key, marked B, replace.
- 7. Tighten setscrew(s) marked A.
- 8. Replace and retension belt(s).
- 9. Realign drive if necessary.

VII. TROUBLESHOOTING

For troubleshooting of the duct furnace, refer to Outdoor Rooftop Gas-Fired Duct Furnace Installation and Service Manual. For Evaporative Cooler/Cooling Coil equipped units, refer to these specific manuals for additional troubleshooting guides.

For additional troubleshooting, see following Troubleshooting Guide.

TROUBLESHOOTING GUIDE – AIR BLOWER

PROBLEM	PROBABLE CAUSE	SOLUTION
1. Noise	Blower Wheel Hitting Scroll Side	a. Blower Wheel not centered in blower housing.
		b. Damaged blower housing.
		c. Damaged blower wheel.
		d. Shaft loose in blower bearing.
		e. Blower Wheel loose on shaft.
		f. Blower bearing loose in bearing support.
	Blower Wheel Hitting Cutoff	a. Cutoff not secure in blower housing.
		b. Cutoff damaged.
		c. Cutoff improperly positioned.
	Drive	a. Pulley not tight on shaft (motor and/or blower wheel).
		b. Belts too loose. Adjust for belt stretching after 48 hours of operation.
		c. Belts too tight.
		d. Belts wrong cross section.
		e. Belts not matched in length on multi-belt drive.
		 f. Variable pitch pulleys not adjusted so each pulley has same pitch diameter (multi-belt drives).
		g. Misaligned pulleys.
		h. Belts worn.
		i. Motor or motor base loose.
		j. Belts oily or dirty
		k. Improper drive selection
	Bearing	a. Defective bearing.
		b. Needs lubrication.
		c. Loose on bearing support.
		d. Loose on shaft.
		e. Seals misaligned.
		f. Foreign material in bearing.
		g. Worn bearing.
		h. Fretting corrosion between inner race and shaft.
	Shaft Seal Squeal	a. Needs lubrication.
		b. Misaligned.

PROBLEM	PROBABLE CAUSE	SOLUTION
1. Noise	Blower Wheel	a. Loose on shaft.
		b. Defective blower wheel.
		Do not run blower. Contact manufacturer.
		Contact manufacturer.
		c. Unbalanced.
		 d. Worn as a result of contact with abrasive or corrosive material.
	Housing	a. Foreign material in housing.
		 b. Cutoff of other part loose (rattling during operation).
	Electrical	a. Lead-in cable not secure.
		b. AC hum in motor or relay
		c. Starting relay chatter.
		d. Noisy motor bearings.
		e. Single phasing a 3 phase motor.
	Shaft	a. Bent.
		 b. Undersized. May cause noise at blower wheel, bearings or pulley.
		c. If more than two bearings are on a shaft, they must be properly aligned.
	High Air Velocity	a. Duct work too small for application.
		b. Blower selection too small for application.
		c. Registers or grilles too small for application.
		d. Cooling coil with insufficient face area for application
	Obstruction in High Velocity Air Stream	a. Dampers.
	may cause Rattle or Pure Tone Whistle	b. Registers.
		c. Grilles.
		d. Sharp elbows.
		e. Sudden expansion in duct work.
		f. Sudden contraction in duct work.
		g. Turning vanes.
	Pulsation or Surge	a. Blower too large for application.
		b. Ducts vibrate at same frequency as blower pulsations
	Rattles and/or Rumbles	a. Vibrating duct work.
		b. Vibrating cabinet parts.
		c. Vibrating parts not isolated from building.
2. CFM Low -	Blower	a. Forward curved blower wheel installed backwards.
Insufficient Air Flow		b. Blower operating backwards.
		c. Cutoff missing or improperly installed.
		d. Blower wheel RPM too low.
	Duct System	a. Actual system is more restrictive than expected.
		b. Dampers closed.
		c. Registers closed.
		d. Leaks in supply duct.

PROBLEM	PROBABLE CAUSE	SOLUTION
2. CFM Low	Filters	Dirty or clogged.
Insufficient Air Flow	Coil - DX or Chilled Water	Dirty or clogged.
	Obstructions in High Velocity Air Stream	a. Obstruction near unit outlet.
		b. Sharp elbows near unit outlet.
		c. Improperly designed turning vanes.
		d. Projections, dampers or other obstructions in part of duct system where air velocity is high.
3. CFM High -	System	a. Oversized duct work.
Too Much Air Flow		b. Access door open.
		c. Registers or grilles not installed.
		d. Filters not in place.
		e. System resistance lower than anticipated.
	Blower	Blower RPM is too great.
4. Blower Does Not Operate	Installation	a. Incorrect electrical connection.
		b. Wrong voltage.
		c. Blown fuse.
	Unit	a. Broken belt(s).
		b. Loose pulleys.
		c. Power to unit is disconnected.
		d. Motor overload protector has broken circuit.
		e. Optional thermostats, firestats, freezestats may lockout blower operation if set incorrect.

TROUBLESHOOTING GUIDE – ELECTRIC MOTORS

PROBLEM	PROBABLE CAUSE	SOLUTION
1. Motor	Blown fuse or open circuit breaker.	Replace fuse or reset circuit breaker.
	Overload trip.	Check and reset, if manual.
	Improper line connections.	Check connections to unit wiring diagram.
	Improper current supply.	Check to determine that power supply agrees with motor nameplate specifications.
	Mechanical failure. Check bearings.	Determine that motor and drive turn freely.
	Motor overloaded.	Reduce load or replace motor.
	With a 3 phase power source, one phase may be open.	Check line for open phase.
	Defective capacitor.	Replace capacitor.
2. Motor Stalls	Wrong application.	Consult manufacturer.
	Overloaded motor.	Reduce load or replace motor.
	Low line voltage.	Check across AC line and correct if possible.

PROBLEM	PROBABLE CAUSE	SOLUTION
3. Motor runs and then	Partial loss of line voltage.	Check for loose connections.
dies down.		Determine adequacy of main power supply.
4. Motor does not	Motor undersized for application.	Replace with larger motor.
come up to speed.	Voltage too low at motor terminals.	Check across AC line and correct if possible.
	Line wiring to motor is too small.	Install larger line wiring.
5. Motor takes too long	Excessive load.	Replace with larger motor.
to accelerate.	Loose connection.	Check connections and tighten where necessary.
6. Wrong Rotation (3 Phase)	Improperly wired to AC line (wrong	Check unit wiring diagram. Reverse any two line
	sequence of phases).	voltage connections.
7. Motor Overheats	Motor overloaded.	Replace with larger motor.
	Motor ventilation clogged.	Clean motor.
	Motor (3 phase) may have open phase.	Check to insure that all connections are tight.
	Line voltage too high or too low.	Check across AC line and correct if possible.
	Worn blower bearings.	Replace blower bearings.
8. Motor Vibrates	Motor mounting bolts loose.	Tighten mounting bolts.
	Driven equipment unbalanced.	Balance driven equipment.
	Worn motor bearings.	Replace motor.
	3 phase Motor running on single phase.	Check for open circuit and correct.
	Bent motor shaft.	Replace motor.
9. Rapid Motor Bearing Wear	Excessive overhung load due to over tensioned belt.	Reduce belt tension.

TROUBLESHOOTING GUIDE – FAN ASSEMBLY

PROBLEM	PROBABLE CAUSE	SOLUTION				
1. Short Belt Life	Spin burns from belt slippage.	Tension belt.				
	High ambient temperature.	Use Gripnotch belts.				
	Grease or oil on belts.	Clean belts and pulleys.				
	Worn pulleys.	Replace pulleys.				
	Belt Misalignment.	Realign drive.				
2. Belts turn over in grooves	Damaged belt.	Replace belt.				
	Excessive vibration.	Tension belts. Replace belts if damaged.				
	Worn pulleys.	Replace pulleys.				
	Pulley Misalignment.	Realign drive.				
3. Belt Squeal	Excessive load.	High starting load.Retension drive.				
4. Belt Breakage	Foreign material in drive.	Provide drive guard.				
	Belts damaged during installation.	Replace belts.				
	Extreme Overload.	Eliminate overload.				
5. Excessive Vibration	Damaged belt cord section.	Replace belts.				
	Loose belts.	Tension drive.				
	Belts improperly tensioned.	Tension drive with slack of each belt on the same side of drive.				

PROBLEM	PROBABLE CAUSE	SOLUTION				
6. Belts mismatched after service	Belts improperly tensioned, causing more stretch of some belts than others.	Replace belts and tension drive with slack of each . belt on the same side of the drive.				
	Old belts and new belts used on same drive.	Replace with new belts.				
	Different brand name belts used on same drive.	Replace with a set of Machine Matched Belts.				
	Driver and driven shafts shifted from parallel.	Realign drive.				
	Belt cord section damaged during installation.	Replace belts and install properly.				
7. Drive fails to adjust	Fretting corrosion (drive allowed to operate at one speed over a period of time).	Driver pulley must be disassembled, cleaned and lubricated, then reassembled.				

TROUBLESHOOTING GUIDE – DX COOLING COIL

PROBLEM	PROBABLE CAUSE	SOLUTION				
1. No or Insufficient	Coil icing.	a. Low liquid line pressure.*				
Cooling		b. Thermal expansion valve.**				
		c. Low air flow across coil.				
	Air binding.	Purge and charge system.				
	Thermal expansion valve.**	a. Bulb mounted at incorrect location.				
		b. Bulb not secured properly.				
	Insufficient air flow.	a. See air blower troubleshooting.				
		b. Clogged coil				
	Air bypassing coil.	Caulk safe off.				
	Undersized system, demand	Replace system.*				
	exceeding cooling system capacity.					
	Too much outside air.	Check outside air dampers.				
	Refrigerant leak.	Determine leak location and correct.				
	Low liquid pressure.	Determine cause and correct.*				
2. Water in Conditioned Air	Exceeding coil face velocity - 600 fpm. Drain pan p-trap clogged.	Reduce unit air flow. Clean pan and p-trap.				

* Refer to condensing unit installation and service manual. **Refer to thermal expansion valve installation instruction.

TROUBLESHOOTING GUIDE – CHILLED WATER COOLING COIL

PROBLEM	PROBABLE CAUSE	SOLUTION				
1. No or Insufficient Cooling	Circulating pump failure.	Repair or replace pump.*				
	Chilled water temperature not cool enough.	Check chiller.*				
	Air binding (air in coil).	Bleed coil.				
	Insufficient chilled water flow.	a. Circulating pump capacity is inadequate.*				
		b. System piping losses too great.				
	Insufficient air flow.	a. See air blower troubleshooting.				
		b. Clogged coil				
	Air bypassing coil.	Caulk safe off.				
	Undersized system, demand exceeding cooling system capacity.	Replace system.*				
	Too much outside air.	Check outside air dampers.				
. Water in Conditioned Air	Exceeding coil face velocity - 600 fpm.	Reduce unit air flow.				
	Drain pan P-trap clogged.	Clean pan and p-trap.				

*Refer to Manufacturer's Installation and Service Manual.

VIII. REPLACEMENT PARTS

To order Replacement Parts, please provide the following information to your local representative:

- Model Number
- Serial Number
- Part description and Number as shown in Replacement Parts Literature

If further assistance is required, please contact the manufacturer's customer service department

IX. SERVICE NOTE

Due to the many configurations, options and voltage characteristics available on Rooftop Packaged Units, the information provided in this manual is somewhat general in context. Should user or service organization incur a problem, the nature of which is not herein, we urge you to contact the manufacturer. It would be of great assistance to us if you can provide the model and serial numbers and the wiring diagram number, as well as the access type.

X. LIMITED WARRANTY

All components are warranted by the manufacturer to be free from defects in material and workmanship for period of one (1) year from the date of shipment from the manufacturing plant.

The manufacturer will repair or replace, at its option, any component which, upon inspection, it finds to be defective, provided that the Rooftop Packaged Unit has been operated within its listed capacity, has been installed in accordance with all furnished instruction, has not been misused or subjected to neglect and has received reasonable and necessary maintenance. This warranty does not cover labor costs or other costs incurred in repairing, removing, installing, servicing or handling of parts or completed products.

This Warranty does not cover loss due to corrosion by chemicals precipitated in the air such as halogenated hydrocarbons. The manufacturer will in no event be liable for incidental or consequential damages of any kind whatsoever.

Written permission is required prior to the return of defective components. All returns must be sent with all transportation charges prepaid to the plant designated in the written permission. This warranty is extended only to the original owner of the Rooftop Package Unit.

XI. UNIT NET & SHIP WEIGHTS

NOTE: ALL UNIT WEIGHTS ARE LESS MOTOR, OUTSIDE AIR HOOD AND COOLING COILS W/ DRAIN PAN FOR UNITS ORDERED WITH DOUBLE WALL CONSTRUCTION (OPTIONAL) ADD AN ADDITIONAL 10% OF THE BASE UNIT WEIGHT

RT = NATURAL VENT, PV = POWER VENT (REFER TO MODEL # DESCRIPTION)

1, 2 - Unit Type [UT]

- RT Natural Vent Rooftop PV - Power Vented Rooftop
- AH Air Handler
- EV Evaporative Cooler Only

3.4 - Capacity [CA] Si

40 - 400,000 BTU/HR

Single Furnace	Double Furnace
10 - 100,000 BTU/HR	50 - 500,000 BTU/HR
15 - 150,000 BTU/HR	60 - 600,000 BTU/HR
20 - 200,000 BTU/HR	70 - 700,000 BTU/HR
25 - 250,000 BTU/HR	80 - 800,000 BTU/HR
30 - 300,000 BTU/HR	
35 - 350,000 BTU/HR	Triple Furnace

Triple Furnace 12 - 1,200,000 BTU/HR

- 5 Furnace / Access Type [FT]
 A Standard Temperature Rise (20-60 Deg. F), Right Side Access
 B Standard Temperature Rise (20-60 Deg. F), Left Side Access
 *C High Temperature Rise (60-90 Deg. F), Right Side Access
 *D High Temperature Rise (60-90 Deg. F), Left Side Access

- 0 None
- Z Othe
- *Note: Unit Type [PV] not available in Capacity [30].

6 - Furnace Construction Material [FM]

- 1 Aluminized Steel 2 - 409 Stainless Steel (First Furnace Only)
- 3 409 Stainless Steel (All Furnace Sections) 4 321 Stainless Steel (First Furnace Only)
- 5 321 Stainless Steel (All Furnace Sections)
- 6 409 Stainless Steel Package (First Furnace Only) 7 409 Stainless Steel Package (All Furnace Sections)
- 8 321 Stainless Steel Package (First Furnace Only)
- 9 321 Stainless Steel Package (All Furnace Sections)
- 0 None Z - Other

7 - Rooftop Arrangement (B - L assumes furnace sections) [RA]

- A Duct Furnace B - Blower (Standard) C - Blower (Standard) / Plenum
- M Air Handler (Standard) N - Air Handler (Standard) / Plenum P - Air Handler (Standard) / Evap. R - Air Handler (Standard) / Evap. / Plenum S - Air Handler (High CFM) T - Air Handler (High CFM) / Plenum U - Air Handler (High CFM) / Cooling W - Air Handler (High CFM) / Cooling /Plenum

4 Row 6 Row

J - Blower (High CFM) / Plenum K - Blower (High CFM) / Cooling L - Blower (High CFM) / Cooling / Plenum 0 - None Z - Other

8 - Coil Options [CO]

D - Blower (Standard) / Evap.

E - Blower (Standard) / Evap. / Plenum G - Blower (High CFM)

A - DX Coil, 4 Row, Single Circuit	E - Chilled Water Coil,
B - DX Coil, 4 Row, Dual Circuit	G - Chilled Water Coil,
C - DX Coil, 6 Row, Single Circuit	0 - None
D - DX Coil, 6 Row, Dual Circuit	Z - Other (Special)

9 - Gas Type [GT]

- 1 Natural Gas 2 LP Gas (Propane)
- 3 Natural Gas w/100% Shutoff 0 - None

10 - Gas Control [GC]

- A Single Stage Gas (Standard) B Two Stage Gas
- H Electronic Modulation w/Room Sensing
- J Electronic Modulation w/Duct Sensing K Electronic Modulation w/Duct Sensing & Ovrd. Stat

- L Electronic Modulation w/External 4-20 mA Input (Furnace One)
 M Electronic Modulation w/External 4-20 mA Input (All Furnaces)
 N Electronic Modulation w/External 0-10 VDC Input (Furnace One)
- P Electronic Modulation w/External 0-10 VDC Input (All Furnaces) R Two Stage Remote Temperature Control w/Duct Sensor

- Fine Orage Teining Teining terminate terminate without without Sensor
 Four Stage Remote Temperature Control w/Duct Sensor
 V S-350 2 Stage Modular Electronic Control System
- W S-350 3 Stage Modular Electronic Control System
- X S-350 4 Stage Modular Electronic Control System Y S-350 6 Stage Modular Electronic Control System
- 0 None
- 7 Other

11 - Supply Voltage [SV]

1 - 115/1/60	5 - 230/3/60
2 - 208/1/60	6 - 460/3/60
3 - 230/1/60	7 - 575/3/60
4 - 208/3/60	0 - None

12 - Motor Type [MT]

- 1 Open Drip Proof (Standard) - Totally Enclosed
- 3 Premium Efficiency, Open Drip Proof

Z - Other

- 4 Premium Efficiency, Totally Enclosed
- 0 None Z - Other

34

13 - Motor Sizes [MS]

A - 1/2 HP. w/Contactor	M - 1-1/2 HP. w/Mag. Starter	1 - 1 HP. VFD
B - 3/4 HP. w/Contactor	N - 2 HP. w/Mag. Starter	2 - 1-1/2 HP. VFD
C - 1 HP. w/Contactor	P - 3 HP. w/Mag. Starter	3 - 2 HP. VFD
D - 1-1/2 HP. w/Contactor	R - 5 HP. w/Mag. Starter	4 - 3 HP. VFD
E - 2 HP. w/Contactor	S - 7-1/2 HP. w/Mag. Starter	5 - 5 HP. VFD
G - 3 HP. w/Contactor	T - 10 HP. w/Mag. Starter	6 - 7-1/2 HP. VFD
H - 5 HP. w/Contactor	U - 15 HP. w/Mag. Starter	7 - 10 HP. VFD
J - 1/2 HP. w/Mag. Starter	0 - None	8 - 15 HP. VFD
K - 3/4 HP. w/Mag. Starter	Z - Other	

14 - Air Inlet Configuration [AI]

- 4 Outside Air and Return Air (OA/RA) 1 - Outside Air (OA)
 - 5 Outside and Return Air w/Air Hood 0 None
- 2 Outside Air w/Air Hood 3 Return Air (RA)

L - 1 HP. w/Mag. Starter

Z - Othe

15 - Air Control & Damper Arrangement [AC]

- A Outside Air 2 Pos. Motor / Spring Return
 B Return Air 2 Pos. Motor / Spring Return
 C OA/RA 2 Pos. / Spring Return
- D OA/RA Mod. Mtr. w/Mixed Air Control / Min. Pot.
- E OA/RA Mod. Mtr. w/Mixed Air Control / Min. Pot. / SR G OA/RA Mod. Mtr. w/Mixed Air Control
- H OA/RA Mod. Mtr. w/Mixed Air Control / SR
- J OA/RA Mod. Mtr. w/Min. Pot. K OA/RA Mod. Mtr. w/Min. Pot. / SR
- L OA/RA Mod. Mtr. w/Dry Bulb / Mixed Air Control / Min. Pot. M OA/RA Mod. Mtr. w/Dry Bulb / Mixed Air Control / Min. Pot. /SR N OA/RA Mod. Mtr. w/Enthalpy Controlled Economizer / SR

- P OA/RA Mod. Mtr. w/Pressure Control (Space Pressure) Q OA/RA Mod. Mtr. w/Carbon Dioxide (CO₂) R/A Monitor R OA/RA Mod. Mtr. w/S-350-P Proportional Mixed Air Control / SR
- S OA/RA Mod. Mtr. w/0-10 VDC & 4-20 mA Analog Input (External Input)
 T OA/RA Mod. Mtr. w/0-10 VDC & 4-20 mA Analog Input / SR (External Input)
 U ASHRAE Cycle I (OA/RA 2 Pos. Mtr. w/Warm-up Stat / SR)
- W ASHRAE Cycle II (OA/RA Mod. Mtr. w/Warm-up Stat / Mixed Air / Min. Pot. / SR) X ASHRAE Cycle III (OA/RA Mod. Mtr. w/Warm-up Stat / Mixed Air / SR)

H1 - Return Firestat

H2 - Supply Firestat

H3 - Freezestat w/Time Delay H4 - Ambient Lockout - Single Furnace H6 - Ambient Lockout - Dual Furnace

H7 - Ambient Lockout - Triple Furnace

J1 - Interlock Relay - 24V Coil DPDT 10A, Plug-in J2 - Interlock Relay - 24/115V Coil SPDT 10A J3 - Interlock Relay - 24/115/230V Coil DPDT 10A

J4 - Interlock Relay - 24V Coil 4PDT 10A
 K1 - Manual Reset High Limit Switch
 K2 - High / Low Gas Pressure Limit Switches

K3 - Status Lamp (Elec. Cabinet)
K4 - Fan Time Delay (Arrangement "A" Only)
K5 - Air Flow Prove Switch (Dwyer 1910-0)*†*

L2 - 30 Amp, Non Fused Disconnect Switch †

L1 - 30 Amp, Fused Disconnect Switch +

L3 - 60 Amp, Fused Disconnect Switch t L4 - 60 Amp, Non Fused Disconnect Switch t

N2 - Through the Base Utility Penetration N3 - Service Convenience Package

N9 - ERMS Connections

R1 - Field Installed VFD

R2 - Factory Installed VFD

R6 - Pressure Sensor † R7 - 2-Speed VFD Relays

R8 - 3-Speed VFD Relays

0 - None

Z - Other (Specify)

t = Field Installed

R9 - VFD Enclosure for use with R2

N6 - Double Wall Construction N7 - Vent Cap Extension (Unit Type RT only)

R3 - VFD Remote Keypad for use with w/R1 $^+$ **R4** - CO₂ Sensor - 100% OA $^+$ **R5** - CO₂ Sensor - Mixed Air $^+$

- Y Manual Dampers
- 0 None
 - MOD = Modulating Damper Motor Z - Other OA = Outside Air RA = Return Air SR = Spring Return

16 - Accessories [AS] A1 - Moisture Eliminators

- A2 Horizontal Return
- A3 Low Leak Damper A5 Furnace Drip Pan, 409 Stainless
- A6 High Altitude Unit
- A7 High Pressure Regulator A7-1/2-1 Regulator for 0.5-10 PSI

B1 - Filters - 1" WA (Standard)

C1 - Evap. Cooler - Fill & Drain Kit

D1 - Time Clock - 7 Day D2 - Time Clock - 24 Hour t

E1 - Clogged Filter Switch

E3 - Remote Control Panel †

E4 - Manual Blower Switch

F1 - Ductstat - One Stage #

F2 - Ductstat - Two Stage

C2 - Evap. Cooler - 12" CELdek[®] Media C3 - Evap. Cooler - Freezestat w/o Time Delay

C4 - Evap. Cooler - 8" GLASdek[®] Media C5 - Evap. Cooler - 12" GLASdek[®] Media

E2 - G.F.I. Convenience Outlet 115VAC+

G1 - Thermostat - T87K w/Subbase† G2 - Thermostat - T87K w/Subbase & Guard† G3 - Thermostat - T834N w/Subbase (Sterling Stat)†

G4 - Thermostat - TH8320R - 7 Day Programmable +

G5 - Thermostat - TH5220D (Two Stage) G6 - Locking Thermostat Cover

Note: All thermostats are mercury free

B2 - Filters - 2" WA

B3 - Filters - 2" TA B4 - Filters - 1" 30%

B5 - Filters - 2" 30%

- A7-3/8-1 Regulator for 10-20 PSI A7-5/16-1 Regulator for for 20-35 PSI
- A8 Unit De-rate

GENERAL With power and gas off.

- Make certain all packing has been removed.
- **T**ighten all electrical terminals and connections.
- Check damper linkages for tightness.
- Check all fans & blowers for free movement.
- Check all controls for proper settings.
- Check all set screws on blowers and bearings.
- Check belt tightness.

BLOWER With power on and gas off.

- Check voltage L1 ____ L2 ____ L3 ____
- Check rotation of main blower.
- Check motor amps L1 _____ L2 ____ L3 ____
- Blower RPM _
- Check air filters. (Record quantity & size.)

GAS HEATING With power and gas on.

Inlet gas pressure. ______ in. W.C. or _____ kPa
Pilot & main burner ignition.
Manifold gas pressure. ______ in. W.C. or _____ kPa
Cycle on HIGH LIMIT.
Cycle firestat and/or freezestat.
Check electronic modulation. Set at: ______
Cycle and check all other controls not listed.
Check operation of remote panel.
Entering air temp. _____ °F or ____ °C
Discharge air temp. (high fire) _____ °F. or _____ °C
External static pressure _____ in. W.C. or _____ kPa
Cycle by thermostat or operating control.
