

INSTALLATION INSTRUCTIONS

LINOVECTOR II COMMERCIAL FINNED-TUBE RADIATION LV2-R, S, T

Not Recommend For Steam Applications.

1. Determine quantities of enclosure and accessories required per wall or run. If installation is wall-to-wall, run backplate to within ½" of adjoining wall(s). If run ends with end cap, extend backplate beyond end of required enclosure 1-1/2" for 3" end and 6" for 8-3/8" end.

2. Mount backplate (full or partial) to wall at prescribed height (Refer to Submittal Drawing) making sure that it is straight and level. If valve compartments are being used, make sure that an equivalent amount of backplate is installed.

3A. Hot Water Systems: Water brackets are used to support the enclosure and a single tier of element. Water brackets do not provide pitch for the element. If a second tier (row) of element is to be installed, a wall mounted hanger will need to be installed adjacent to the water bracket so that the center line of the second element tube is 5" for S style enclosure (6" for RD and T style enclosure) above the bottom element center line. Install two (2) water brackets per enclosure length up to 6'-0" of length. Three (3) water brackets per cover 6'-6" up to 8'-0" of length. Valve compartments should have a minimum of one (1) bracket (Accessories do not require brackets). Insert top of the bracket into 'V' bend of backplate (Full or Partial) and insert onto horizontal flange of the Partial backplate. Secure brackets to wall using fasteners (as specified) by others. Supply/Return Pipe hangers (if required) can be mounted to the wall adjacent to the water bracket (every other one). Consult submittal sheet for conditions that will not allow a Supply/Return Pipe Hanger.

3B. Steam Systems (Two Pipe): Not Recommend For Steam Applications.

Bracket mounted hangers used to support the element(s) are not available for this product. A wall mounted hanger will be required to support and pitch the element. These will have to be installed so that the supply end of the element will be the highest point and pitch down at a rate of ½ inch per 20 foot run. Check length of longest run to insure that the element will not interfere with the sloped surface of the enclosure.

4. Lay out heating element as required. Place slide cradle onto the bottom of element at each bracket location. The element cradle has two legs that angle out slightly. Position the legs between the fins so there is tension against the legs. This holds the cradle in position. Check submittal drawing for correct position of element fin. **For copper tube elements, flush the loop or series with system water after soldering to neutralize the remaining flux material and prevent corrosive action and resulting pinhole leaks.**
5. The enclosure can now be installed unless damper assembly is required (see damper installation sheet packed with damper blades). Start enclosure at left end of run, working clockwise. The enclosure back bend mounts directly into the 'V' bend of backplate. Firmly push next piece of cover into slip joint tabs of piece on left until run is completed. Secure bottom of enclosure into brackets. Tighten the posi-loc clamps to secure the enclosure.
6. Install overlapping accessories as indicated on room schedule. All accessories are overlapping. Valve Compartments are installed the same as enclosure. The top back bend is slipped between the wall and the backplate. The accessory bottom returns to the wall and is secured with fasteners by others.

MAINTENANCE

Before each heating season, remove accessories and enclosure panel to inspect finned tube elements for accumulation of dust or other debris that may accumulate and block airflow between fins. Remove dust and debris from coil fins with a vacuum cleaner or compressed air. Inspect for leaks or areas of corrosion. It should not be required, but if necessary, place a drop of lubricant (machine oil) onto each ball bearing (where applicable) located in the water brackets or bracket mounted hangers. Replace cover and accessories.
